Bubble sort

Get the last index of the array and then swap it with the left one until find a smaller one. Then after first iteration first element is sorted. Repeat process until all elements are sorted.

Selection sort

Make a linear minimum search, and swap its index with the one with the most left element.

Insertion sort

Take the N element element and shift left until find the smallest element and then stak them in smaller to higher.

Heap sort

First element is taken as a head , if the next element is smaller then insert it at left , if the next element is higher then put it in the right branch and then swap right branch with head. Put the heap in descending order.

Merge Sort

Divide the array in $n/2$ and then in $n/2$ and so on until you have only two elements. Each particle of two elements, compare them and then order it from smaller to bigger, after having two particles merge them. Repeat the process until there are no more particles.

Quick sort

Have tres pivots, L,R ,P .

The pivot is mostly chosen at random and is a marker.

Left marker will be placed on the leftmost number. And a right marker will be placed on the rightmost number.

Left marker will move to the right until reaches a higher number than the pivot.

Right maker will move to the left until reaches a number less than the pivot.

When both left and right markers stopped the markers numer are swapped.

Movement also stops when the right marker runs into the left marker

When both markers are the same there is a swap with the pivot. And pivot changes. To the left of the pivots colitions.
